Beautiful Dark Green Colour the Whole Season

Microclover® takes care that the companion grasses are well feed with nitrogen which makes them look great. At the same

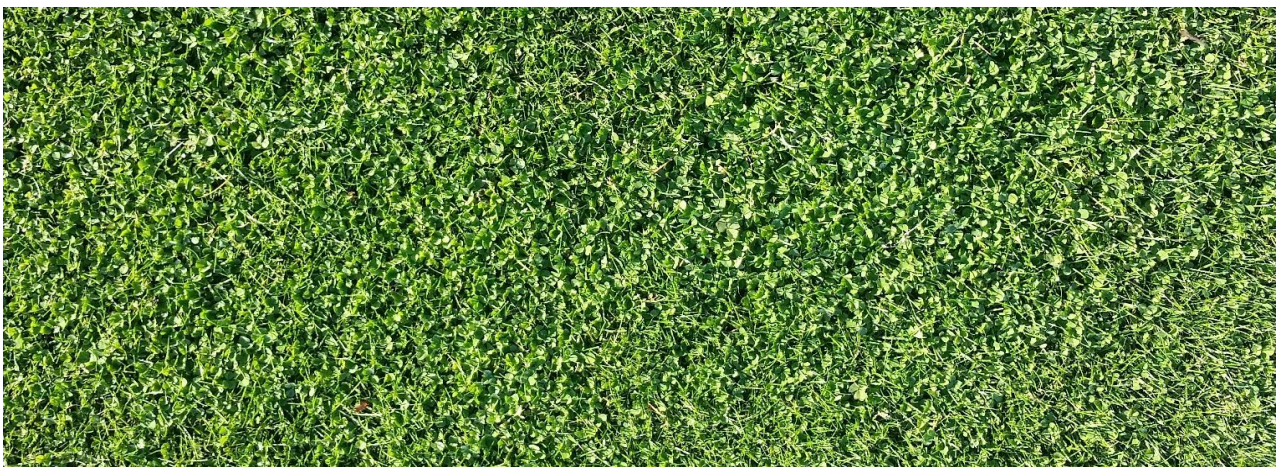

time the Microclover® itself has a nice darker green colour and together this gives the lawn the most beautiful darker green colour right from spring to autumn. It is recommended to include Microclover® in the seed mixture with 5% by weight.

Improved Drought Tolerance

Inclusion of Microclover® in the grass mixtures has the effect that the soil is shaded a bit more and moisture is retained more in the dry summer. The deep green colour also sustains the overall lush appearance of grass through difficult drought periods.

Very Healthy Lawn

The "spoon feeding" of the grasses with nitrogen from Microclover® secures a nice and more even growth of the grasses in the mixture. The vital growth keeps the grasses healthy and free of diseases.

Successful overseeding of pure grass with Microclover®
