

## Westerwold/annual ryegrass

Fast establishment in harsh conditions

- Very quick establishment
- Germinates at lower minimum temperatures
- Reaches a good ground cover faster and nurses the other grasses sown at the same time
- When the nurse job is done, it should disappear fast, and it does!

## Ratings

## Quicker establishment = short time to good ground cover = saving the playing quality

Appearance is important, but the role of Candidame is above all to secure a quick cover of the ground in difficult situations **and then degenerate and disappear!**

## Perfect for nursing the traditional species in the mixture

We recommend a low rate of Candidame, because, as a nurse species it should produce a quick ground cover while not competing excessively with the perennial species in the mixture.

## Candidame has a darker green colour than previous generations

This is often an advantage for a more visual homogeneity.

## Leaf texture

The fineness of leaves is finer and again an advantage in terms of visual merit.

## Period of overseeding

*Recommended % of each species in the mixture*

Species	Characteristic	Late autumn	Winter / Early spring	Spring till autumn
Westerwoldicum turf types	Rapid green up	25	50	X
4turf perennial ryegrass	Summer & winter stress tolerance, low temperature germination	25	25	X
Rough-stalked meadow-grass	Shade tolerance	20	X	X
Diploid perennial ryegrass (Low temperature germination)	Wear tolerance & Rapid germination	30	25	X
Diploid perennial ryegrass (All)	Wear tolerance	X	X	100
Total		100%	100%	100%
