Strong rhizomes

Edwin is a *Poa pratensis* which forms a very dense sward with its strong rhizomes. In long-lasting pastures, the farmer will suppress weeds and establish a very dense sward.

Less rust in your sward

In our international breeding program EDWIN was created with an improved rust tolerance. By using EDWIN in your pasture, you will see less rust on the leaves in your field. This makes it easier for you to protect your plants!

Reliable mixing partner

What would it mean to you if you could lower your risks by having an improved persistency? Test results in Germany and Czech Republic prove, that EDWIN will show its benefits over several harvest years. Additionally, you will reduce your risk and insure a high yield before the summer drought. In combination with the high persistency you will soon find out, that EDWIN is your reliable mixing partner.

“Due to the rhizomes Edwin is a true survivor in the sward and a real gap filler; one *Poa* plant can fill a square meter within a year!”

Henk van der Aa, breeder DLF
