Low Maintenance

Attractive Dark Green Colour Throughout The Season

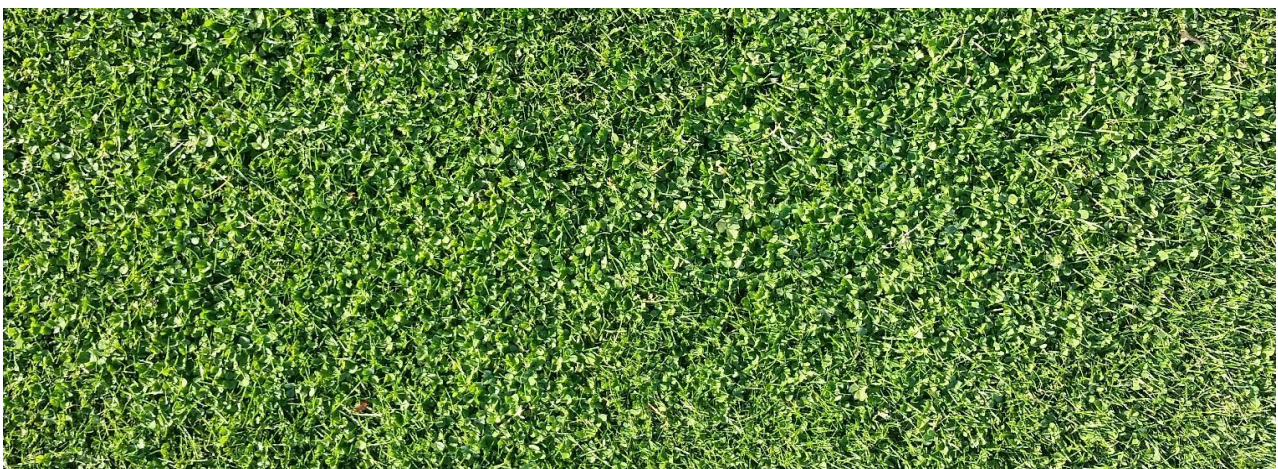

Microclover® ensures that the companion grasses are well nourished with nitrogen which makes for improved visual appearance. The Microclover® itself has an attractive darker green colour that gives the lawn a superb dark green colour throughout the season. The recommended share of seed mixtures with Microclover® is 5% by weight.

Better Performance During Dry Periods

Adding of Microclover® in the grass mixtures has the advantage that the soil is shaded a little more and humidity is retained better in the dry periods. The deep dark green colour also extends the overall lush appearance of grass through dry spells.

Low Disease Incidence

The constant adequate feeding of the grasses with nitrogen from Microclover® ensures an attractive and more homogeneous growth of the grasses. This keeps the grasses healthy and provides better tolerance to wear and stress.

Successful overseeding of pure grass with Microclover®
